

What type of data would be measurable on a European scale (in each country) to better inform Semester process?

- **Mortality data**
- **Morbidity data**
- **Functioning data**

Mortality data

Appropriate data collection

Identification of intellectual disability, autism and learning difficulty

Identification of appropriate cause(s) of death using ICD-11 axis

How does each country collate this data and use this data to inform policy and practice?

Morbidity data

Appropriate data collection

Identification of intellectual disability, autism and learning difficulty

Identification of appropriate health conditions using ICD-11 axis

How does each country collate this data and use this data to inform policy and practice?

Functioning data

Relationship with health and environmental factors (physical environment, social support, assistive technologies, attitudes, etc.)

How measure functioning (WHO ICF 11) and also costs?

What is good quality rehabilitation (what are the key components)?

How does each country **collate and use this data** address current and future needs?

What type of data would be measurable on a European scale (in each country) to better inform Semester process?
